

ABSTRACT OF THE DISCLOSURE

An orthopaedic reamer for cutting bone includes a rotatable shaft and a cutting head coupled with the shaft. The cutting head includes a distal face with a radius and a plurality of cutting teeth. Each cutting tooth includes a pair of opposed side walls extending from the distal face and a cutting edge extending between the side walls. Each cutting edge includes at least
5 three adjoining segments. Each segment has a radius which is less than the radius of the distal face.
